The first chapters are concerned with the construction of a basic theory of fractional powers and study the classic questions in that respect. A new and distinct feature is that the approach adopted has allowed the extension of this theory to locally convex spaces,

context of the collatz-problem. For some rational  $a=b/c$  I expressed the powers as irregular fractions and plotted the fractional part against the denominator and got some nice pictures. For the collatz-problem it was relevant, whether the dots for  $1.5^N$  are all below the main diagonal. But I found some nice structures for some ...
